Iris Flower Data

	Sepal Length (cm)	Sepal Width (cm)	Target
0	5.1	3.5	0
1	4.9	3.0	0
2	4.7	3.2	0
3	4.6	3.1	0
4	5.0	3.6	0
5	5.4	3.9	0
6	4.6	3.4	0
7	5.0	3.4	0
8	4.4	2.9	0
9	4.9	3.1	0

Logistic regression as a linear classifier

- The linear combination z ,

$$z = \theta_1 x_1 + \theta_2 x_2,$$

Logistic regression as a linear classifier

- The linear combination z ,

$$z = \theta_1 x_1 + \theta_2 x_2,$$

- can be represented as the matrix equation

$$\underbrace{\begin{bmatrix} x_1^1 & x_2^1 \\ x_1^2 & x_2^2 \\ \vdots & \vdots \\ x_1^{150} & x_2^{150} \end{bmatrix}}_{150 \times 2} \cdot \underbrace{\begin{bmatrix} \theta_1 \\ \theta_2 \end{bmatrix}}_{2 \times 1} = \underbrace{\begin{bmatrix} z_1 \\ z_2 \\ \vdots \\ z_m \end{bmatrix}}_{150 \times 1}$$

Hypothesis Representation

Sigmoid/Logistic Function: $g(z) = \frac{1}{1 + e^{-z}}$

Hypothesis Interpretation

Predictions interpreted as Probabilities

$$h_{\theta}(x) = g(z) = \frac{1}{1 + e^{-z}}$$

Hypothesis Interpretation

Predictions interpreted as Probabilities

$$\begin{aligned}h_{\theta}(x) &= g(z) = \frac{1}{1 + e^{-z}} \\ &= p(y = 1|x; \theta)\end{aligned}$$

 - Interpretation
- 5 **Cost Function**
 - When $y = 1$
 - When $y = 0$
- 6 Gradient Descent

$$\text{Cost}(h_{\theta}(x), y) = \begin{cases} -\log(h_{\theta}(x)) & \text{if } y = 1 \\ -\log(1 - h_{\theta}(x)) & \text{if } y = 0 \end{cases}$$

- the domain of $\text{Cost}(h_{\theta}(x), y)$ is $[0, 1]$.

When $y = 1$

When $y = 0$

When $y = 1$

Figure: $\text{Cost}(h_{\theta}(x), y)$ when $y = 1$

as $h_{\theta}(x) \rightarrow 1$, $\text{Cost}(h_{\theta}(x), y) \rightarrow 0$

as $h_{\theta}(x) \rightarrow 0$, $\text{Cost}(h_{\theta}(x), y) \rightarrow \infty$

When $y = 0$

Figure: $\text{Cost}(h_{\theta}(x), y)$ when $y = 0$

as $h_{\theta}(x) \rightarrow 1$, $\text{Cost}(h_{\theta}(x), y) \rightarrow \infty$

as $h_{\theta}(x) \rightarrow 0$, $\text{Cost}(h_{\theta}(x), y) \rightarrow 0$

Simplified Cost Function

Previously, we had defined $\text{Cost}(h_{\theta}(x), y)$ by cases like so:

$$\text{Cost}(h_{\theta}(x), y) = \begin{cases} -\log(h_{\theta}(x)) & \text{if } y = 1 \\ -\log(1 - h_{\theta}(x)) & \text{if } y = 0 \end{cases}$$

Simplified Cost Function

Previously, we had defined $\text{Cost}(h_{\theta}(x), y)$ by cases like so:

$$\text{Cost}(h_{\theta}(x), y) = \begin{cases} -\log(h_{\theta}(x)) & \text{if } y = 1 \\ -\log(1 - h_{\theta}(x)) & \text{if } y = 0 \end{cases}$$

However, it can be compressed:

$$\text{Cost}(h_{\theta}(x), y) = \underbrace{-y \log(h_{\theta}(x))}_{=0 \text{ when } y=0} - \underbrace{(1 - y) \log(1 - h_{\theta}(x))}_{=0 \text{ when } y=1}$$

Gradient Descent

Cost Over Entire Dataset

$$J(\theta) = \frac{1}{m} \sum_{i=1}^m \text{Cost}(h_{\theta}(x^{(i)}), y^{(i)})$$

Gradient Descent

Cost Over Entire Dataset

$$\begin{aligned} J(\theta) &= \frac{1}{m} \sum_{i=1}^m \text{Cost}(h_{\theta}(x^{(i)}), y^{(i)}) \\ &= -\frac{1}{m} \left[\sum_{i=1}^m y^{(i)} \log(h_{\theta}(x^{(i)})) + (1 - y^{(i)}) \log(1 - h_{\theta}(x^{(i)})) \right] \end{aligned}$$

Gradient Descent

Iterative Gradient Descent Algorithm

$$\theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta)$$

The Partial Derivative Term

- When we calculate the partial derivative term $\frac{\partial}{\partial \theta_j} J(\theta)$, we find that

$$\begin{aligned}\frac{\partial}{\partial \theta_j} J(\theta) &= \frac{\partial}{\partial \theta_j} \left(\frac{1}{m} \left[\sum_{i=1}^m \text{Cost}(h_{\theta}(x^{(i)}), y^{(i)}) \right] \right) \\ &= \frac{1}{m} \sum_{i=1}^m \left(h_{\theta}(x^{(i)}) - y^{(i)} \right) x^{(i)}\end{aligned}$$

The Partial Derivative Term

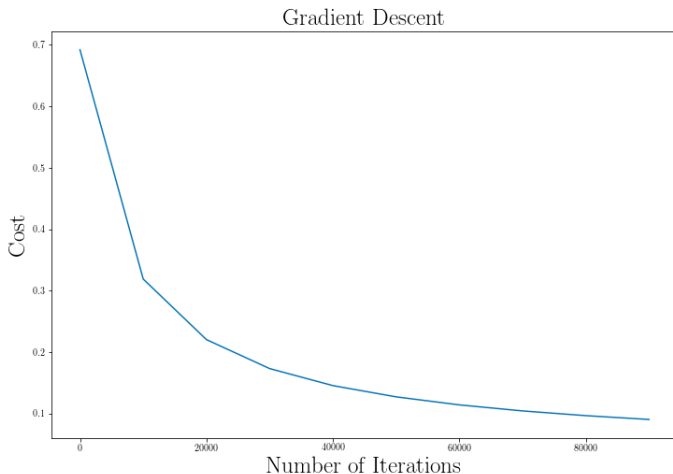

- When we calculate the partial derivative term $\frac{\partial}{\partial \theta_j} J(\theta)$, we find that

$$\begin{aligned}\frac{\partial}{\partial \theta_j} J(\theta) &= \frac{\partial}{\partial \theta_j} \left(\frac{1}{m} \left[\sum_{i=1}^m \text{Cost}(h_{\theta}(x^{(i)}), y^{(i)}) \right] \right) \\ &= \frac{1}{m} \sum_{i=1}^m \left(h_{\theta}(x^{(i)}) - y^{(i)} \right) x_j^{(i)}\end{aligned}$$

Updated Gradient Descent Algorithm

$$\theta_j := \theta_j - \alpha \frac{1}{m} \sum_{i=1}^m \left(h_{\theta}(x^{(i)}) - y^{(i)} \right) x_j^{(i)}$$

The Learning Rate α

Batch Gradient Descent

$$\theta_1 := \theta_j - \alpha \frac{1}{m} \sum_{i=1}^m \left(h_{\theta}(x^{(i)}) - y^{(i)} \right) x_1^{(i)}$$

$$\theta_2 := \theta_j - \alpha \frac{1}{m} \sum_{i=1}^m \left(h_{\theta}(x^{(i)}) - y^{(i)} \right) x_2^{(i)}$$
